

Sichuan province the Tibetan temple

With a long history of the Tibetan temple, it is located at an altitude of 3,000 meters in Sichuan province, and there are Lamas and a living Buddha living inside. They use the water from the mountain spring full of rich minerals, so that the water is relatively hard. The hard water makes the pots scaled and even forms white scale on the inner wall by heating and boiling the pots during the daily life.

After the installation of Vulcan 5000 for a month, the effect is more and more obvious: the scale in the bottom of the pot has been reduced, and the protective metal carbonate layer seems to be formed. We believe that solar water heaters will also improve its heat transfer efficiency over time.

Before Vulcan installed, we used electric stove to boil water, there was hard scale in the pots, we had to scrub very hard to clean every month. After installing Vulcan for a month, the scale has been reduced and the pots are cleaner without any cleaning in this month.

Welcome to the beautiful Tibetan land, near the heaven.

The mountain spring water is relatively hard.

Installed by CWT distributor: Jiangsu Xinriyuan Construction Energy Saving Technology Shareholding Co., Ltd.

There was hard scale in the teapot before Vulcan installed, scrubbing hard to clean every month was necessary.

After installing Vulcan for a month, the scale was reduced and the teapot was cleaner.
